Product Intern Assignment - Cheerio

Read this first

Pick **one** of the two assignments below. We want to see how you think, how you work with AI, and how well you handle numbers.

About Cheerio: Cheerio AI helps businesses grow on the channels their customers already use. We are an official Meta Business Solution Provider. One platform for WhatsApp, AI agents, Email, SMS, Instagram, RCS and AI Voice calling. Brands like IndiaMART, IndusInd Bank, FabHotels and OneVasco run on Cheerio. Most of our users are business owners and marketing teams, not technical people.

AI usage policy

- You are expected to use AI tools (ChatGPT, Claude, Cursor, Lovable, v0, Bolt etc.).
- Fully AI-generated submissions will be rejected automatically. We want your thinking, with AI as your helper.
- Share your AI chat links or screenshots of your key prompts. This is mandatory.

What to submit

1. A short doc (max 4 pages) with your answers.
2. A design prototype link (any clickable mockup).
3. A Google Sheet with your cost and billing numbers.
4. AI chat links / prompt log.
5. Optional: a 3-5 min Loom walking us through your work.

Timeline: 2 days from the day you receive this.

Tip: Keep it simple. Clear and practical beats long and fancy.

Assignment A - Make customer support scale for non-technical users

Problem: Our support team cannot keep up as users grow. Most users are non-technical. They get stuck on setup (WhatsApp API, templates, chatbot flows, integrations) and raise tickets for things they could do themselves. More users means more tickets and more support hires.

Your task: Design and prototype a solution that resolves most of these queries without a human, involving human wherever required. Explore the different ways this could be solved, prioritise them, and pick one.

Part 1 - Solution (approx. 2-3 pages)

1. Who is the user and what are the top 5 queries or issues you would solve first? Why these?
2. List all the possible solutions you can think of. Prioritise them and explain why you picked your final one.
3. Describe your chosen solution. What will it do, and what will it not do?
4. When does a human still need to step in?
5. How will you measure success? Pick 3 metrics.
6. Define a North Star metric: Choose the single metric that best captures the value your solution delivers. Set a realistic target for improving it over the next 3 months (e.g., improve it by X%) and explain how you would achieve that improvement.

Part 2 - Design prototype

1. Create a clickable design prototype of your chosen solution (AI design tools like v0, Lovable, or Claude). No need to build a working product.
2. Cover at least 1 real user scenario end to end, including the key screens and edge cases.
3. Share the link and 3-4 screenshots.

Part 3 - How you used AI

1. Which AI tools did you use and for what?
2. Share 3 prompts that worked well and 1 that failed. What did you change?
3. Where did AI give a wrong or weak answer, and how did you catch it?
4. Which parts did you do yourself, without AI?

Part 4 - Numbers: cost, billing and audit

Do this in a Google Sheet. Maintain your formulas and show assumptions clearly.

1. **Guesstimate:** Cheerio has 5,000 active businesses. Estimate the monthly support queries and how many your solution will resolve.
2. **Running cost:** Estimate the cost per query and per month. If your solution uses AI, include token cost (assume a model price per 1M input and output tokens and state your source).
3. **Billing:** How should we charge for this? Free, per conversation, credits or a plan add-on? Suggest a price and show the margin.
4. **Audit:** How will you audit usage and billing every month to make sure we stay profitable? What alerts or checks will you set up?
5. **Savings:** Compare your solution's cost with the cost of human support for the same volume.

Assignment B - Users don't know what they can do on Cheerio

Problem: Many users sign up, send a few campaigns and stop. They don't discover features like chatbots, automations, CRM or analytics. Low feature discovery leads to low engagement, and low engagement leads to churn.

Your task: Explore the different ways this could be solved, prioritise them, and pick one. Then define your solution clearly and build a prototype.

Part 1 - Solution (approx. 2-3 pages)

1. Pick one user type (for example a D2C brand owner or a coaching institute). What do they need from Cheerio?
2. Which 3 features should they be using but are not? Why?
3. List all the possible solutions you can think of. Prioritise them and explain why you picked your final one.
4. Describe your chosen solution. How does it help the user, and when does it show up?
5. How will you measure success? Pick 3 metrics (for example feature adoption, weekly active users, retention).
6. Define a North Star metric: Choose the single metric that best captures the value your solution delivers. Set a realistic target for improving it over the next 3 months (e.g., improve it by X%) and explain how you would achieve that improvement.

Part 2 - Design prototype

1. Create a clickable design prototype of your chosen solution (AI design tools like v0, Lovable, or Claude). No need to build a working product.
2. Show at least one full journey: user logs in, finds a feature they did not know about, and sets it up.
3. Share the link and 3-4 screenshots.

Part 3 - How you used AI

1. Which AI tools did you use and for what?
2. Share 3 prompts that worked well and 1 that failed. What did you change?
3. Where did AI give a wrong or weak answer, and how did you catch it?
4. Which parts did you do yourself, without AI?

Part 4 - Numbers: cost, billing and audit

Do this in a Google Sheet. Show your formulas and assumptions clearly.

1. **Guesstimate:** Cheerio has 5,000 active businesses. How many will see your feature each month, and how many will adopt at least one new feature?
2. **Running cost:** Estimate the cost per user per month. If your solution uses AI, include token cost (assume a model price per 1M input and output tokens and state your source).
3. **Revenue impact:** If adoption improves retention by X%, what is the extra revenue? Assume an average plan price.

4. **Billing:** Should this be free, part of a higher plan or paid separately? Show the margin.
5. **Audit:** How will you audit usage and billing every month to make sure we stay profitable? What alerts or checks will you set up?
